

FUNCTIONALITY WALKTHROUGH

Topeka IT Portal Guide

A short visual guide to the real portal experience for Super Admins, Managers, and Workers.

Actual screens

Captured from the live local portal using the test role accounts.

Manager-ready

Focused on what people click, see, and hand off.

Simple flows

Create workers, assign lockers, track gear, and report issues.

Clear escalation

Workers report, Managers coordinate, IT and Admin resolve.

The app uses one consistent shell

Every role starts with the same top bar, search, role chip, horizontal navigation, and live fleet pulse.

PrintersAssetsMy requestsLockersLoanersHomeWorkers

Search is global

The command search sits at the top of the app and is visible across roles.

Navigation is permission-driven

Workers see fewer actions, Managers see floor tools, and Super Admins see system tools.

Fleet pulse stays visible

Printer, ticket, asset, and sync signals stay near the top while users move through pages.

The guide follows the actual warm-paper UI: compact cards, thin borders, mono labels, and exception-first operational views.

Each role lands in a different workspace

The same portal adapts from simple reporting to shift coordination to system oversight.

Super Admin

Reports, divisions, Lantronix monitoring, and user access across the portal.

Your recent requests

No requests

You haven't filed anything with IT recently

Managers start with the shift workspace

The first screen answers: who needs help, what equipment is out, what printers need attention, and where to go next.

Employee lookup

Search a worker by name to quickly see locker and device context.

Action tiles

Managers jump directly to lockers, loaners, assets, printers, crew requests, or a new request.

Exceptions stay visible

Outstanding devices, recent crew requests, and devices needing attention sit below the action row.

This page is intentionally practical: it supports the shift without becoming a technical dashboard.

How a Manager creates a worker

The Manager opens Workers, adds a row, fills account details, and saves the new worker in the current division.

1

Open Workers

Use the top navigation. Managers see the page labeled Workers.

2

Add user

Click Add user. The new editable row appears in the table.

3

Fill details

Name, username, position, locker, audit flag, tier, and initial password.

4

Save

The worker can sign in and then use requests and printer status.

Search locker, person, or dev

No lockers

Create the first locker for this division.

Lockers and assets show where equipment belongs

Managers use lockers for physical assignment and the asset console for scanning, category views, status, and pairing.

Lockers

Create lockers, filter empty or attention lockers, assign users, assign devices, and mark audits complete.

Assets

Scan or search, then work through tabs for lockers, SAE devices, TC77 PODs, scanners, and batteries.

Loaners

Issue a spare, select employee, reason, duration, and comments. Return it when the device comes back.

Printers

Printer status is exception-first: down and warning printers are visible, healthy printers stay quiet.

Workers and Managers send issues to IT

Requests are intentionally simple: open a new request, attach the related printer or asset if needed, and track status.
